This comprehensive guide delves into the intricacies of roof valley construction, covering materials, installation techniques, common issues, and best practices to achieve durability and performance.

Understanding Roof Valleys: Function and Types

Before diving into construction details, it's essential to understand what roof valleys are and the different types that exist.

What Are Roof Valleys?

A roof valley is the internal angle formed when two roof planes intersect. It acts as a channel guiding rainwater and melting snow down to the gutters or drainage system. Improperly constructed valleys can lead to leaks, water damage, and roof deterioration.

Types of Roof Valleys

- Closed Valleys: The most common type, where shingles are laid over metal flashing, concealing the valley from view.
- Open Valleys: The metal flashing is exposed, creating a visible valley line. Often used in specific architectural styles.
- Woven Valleys: Shingles from both slopes are woven together, typically used in certain shingle applications.

- Box Valleys: A variation where the valley is boxed in with additional framing or flashing.

Materials Used in Roof Valley Construction

Choosing the right materials is paramount for a valley's longevity and effectiveness.

Metal Flashing

- Galvanized Steel: Durable and cost-effective; provides excellent protection against water infiltration.
- Aluminum: Lightweight and resistant to corrosion, suitable for areas with high humidity.
- Copper: High-end option offering superior corrosion resistance and aesthetic appeal.
- Lead: Traditionally used but less common today due to environmental concerns.

Shingles and Roofing Coverings

- Asphalt Shingles: Commonly used with asphalt or metal valleys; require proper shingle installation techniques.
- Wood Shingles/Shakes: Require specific valley treatments to prevent water intrusion.
- Clay or Concrete Tiles: Need specialized valley flashing to accommodate their weight and shape.

Underlayment

A crucial component that adds an extra layer of protection beneath shingles or other roofing materials. Types include:

- Use synthetic underlayment for better durability, especially in valleys.

4. Installing Valley Flashing

- Cutting and Placement:
 - Cut metal flashing to length, allowing for overlaps.
 - Position the flashing along the valley centerline, extending both up the roof slopes and over the lower edge.
- Sealing and Fastening:
 - Secure flashing with corrosion-resistant nails or screws.
 - Seal overlaps with roofing sealant or butyl tape to prevent water ingress.
- Types of Flashing Installation:
 - Closed Valley: Install the flashing first, then lay shingles over it.
 - Open Valley: Install shingles first, then overlay with metal flashing.

5. Shingle Installation

- Begin shingle installation from the bottom of the roof, working upward.
- In valleys, shingles should be cut to fit neatly into the valley line, ensuring no gaps.
- Use proper shingle overlaps to prevent water from seeping under the shingles.
- For closed valleys:
 - Lay shingles over the flashing, ensuring shingle edges do not extend beyond the valley

centerline.

- For woven valleys:
- Intertwine shingles from both slopes, creating a woven pattern that covers the valley.

6. Final Inspection and Sealing

- Check all seams and overlaps for proper sealing.
- Apply additional sealant or roofing cement at vulnerable spots.
